## Green Power Module (GPM)

### 650V 30A Inverter

#### Features

- 650V / 30A 3-Phase IGBT Inverter
- Low-Losses & Short-Circuit-Rated IGBTs
- Soft Reverse Recovery Diodes
- Built-In Bootstrap Diodes
- Low Thermal Resistance with DBC Substrate
- Separate Open-Emitters from Low-Side IGBTs
- Under-Voltage Lock-Out for high side and low side
- Short-Circuit Protection
- LVIC Temperature Output, Over Temperature Protection
- 3.3 V and 5V Input Logic Compatible : Active High
- Fault Signaling : LVIC UVLO, SC & OT Protections
- Isolation Rating of 2000 Vrms/1 min
- UL 1557 Certified

#### Typical Applications

- Air-conditioner, Washing machine etc.
- Motor Control – Industrial Motor (AC 200 V Class)

**PIN DESCRIPTION**

Pin Number	Pin Name	Pin Description
2	V <sub>SU</sub>	High-Side Bias Voltage Ground for U Phase IGBT Driving
3	V <sub>BU</sub>	High-Side Bias Voltage for U Phase IGBT Driving
4	V <sub>SV</sub>	High-Side Bias Voltage Ground for V Phase IGBT Driving
5	V <sub>BV</sub>	High-Side Bias Voltage for V Phase IGBT Driving
6	V <sub>SW</sub>	High-Side Bias Voltage Ground for W Phase IGBT Driving
7	V <sub>BW</sub>	High-Side Bias Voltage for W Phase IGBT Driving
8	IN(UH)	Signal Input for High-Side U Phase
9	IN(VH)	Signal Input for High-Side V Phase
10	IN(WH)	Signal Input for High-Side W Phase
11	V <sub>DDH</sub>	High-Side Bias Voltage for IC
12	V <sub>SS</sub>	High-Side Common Supply Ground, connected to LVIC
13	IN(UL)	Signal Input for Low-Side U Phase
14	IN(VL)	Signal Input for Low-Side V Phase
15	IN(WL)	Signal Input for Low-Side W Phase
16	V <sub>DDL</sub>	Low-Side Bias Voltage for IC and IGBTs Driving
17	/FO	Fault Output
18	Csc	Input for Current Protection
19	V <sub>SS</sub>	Low-Side Common Supply Ground
20	V <sub>OT</sub>	Voltage Output for LVIC Temperature
21	N <sub>W</sub>	Negative DC-Link Input for W Phase
22	N <sub>V</sub>	Negative DC-Link Input for V Phase
23	N <sub>U</sub>	Negative DC-Link Input for U Phase
24	W	Output for W Phase
25	V	Output for V Phase
26	U	Output for U Phase
27	P	Positive DC-Link Input

- Short-circuit current protection functions only at the low-sides because the sense current is divided from main current at low-side IGBTs. Inserting the shunt resistor for monitoring the phase current at NU, NV, NW terminal, the trip level of the short-circuit current is changed.
- $T_{LVIC}$  is LVIC temperature and  $V_{OT}$  is only for sensing temperature of LVIC and cannot shutdown IGBTs automatically. The relationship between  $V_{OT}$  voltage output and LVIC temperature is described in Figure 5. It is recommended to add a ceramic capacitor of 10 nF or more between  $V_{OT}$  and  $V_{SS}$  (Signal Ground) to make the  $V_{OT}$  more stable. Refer to the application note for this products about usage of  $V_{OT}$ .

PWIN(OFF)			0.7	-	-	
T <sub>j</sub>	Junction Temperature		-40	-	+150	°C

6. This product might not make output response if input pulse width is less than the recommended value.
7. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. The input signal section integrates 5 kΩ (typ.) pull-down resistor. Therefore, when using an external filtering resistor, please pay attention to the signal voltage drop at input terminal.

Figure 13. Typical Application Circuit

NOTES:

8. To avoid malfunction, the wiring of each input should be as short as possible (less than 2–3 cm).
9. Fault output is an open-drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes  $I_{FO}$  up to 1 mA. Please refer to Figure 7.
10. Input signal is active-HIGH type. There is a 5 k $\Omega$  resistor inside the IC to pull-down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation. RC time constant should be selected in the range 50~150 ns (recommended R = 100 $\Omega$ , C = 1 nF). Please refer to Figure 7.
11. Each wiring pattern inductance of point A should be minimized (recommend less than 10 nH). Use the shunt resistor Rsh of surface mounted (SMD) type to reduce wiring inductance. To prevent malfunction, wiring of point E should be connected to the terminal of the shunt resistor R3 as close as possible.
12. To insert the shunt resistor to measure each phase current at NU, NV, NW terminal, it makes to change the trip level  $I_{SC}$  about the short-circuit current.
13. To prevent errors of the protection function, the wiring of point B should be as short as possible.
14. For stable protection function, use the sense resistor Rsh with resistance variation within 1% and low inductance value.
15. In the short-circuit protection circuit, select the RC time constant of protection circuit in the range 2.0~2.5  $\mu$ s.
16. Each capacitor C1 should be mounted as close to the pins of the GPM product as possible.
17. To prevent surge destruction, the wiring between the smoothing capacitor C2 and the P & GND pins should be as short as possible. The use of a high-frequency non-inductive capacitor of around 0.1~0.22  $\mu$ F between the P & GND pins is recommended.
18. Relays are used in most systems of electrical equipment in industrial application. In these cases, there should be sufficient distance between the MCU and the relays.
19. The Zener diode or transient voltage suppressor should be adopted for the protection of ICs from the surge destruction between each pair of control supply terminals (recommended Zener diode is 22V/1W, which has the lower Zener impedance characteristic than about 15  $\Omega$ ).
20. C3 of around seven times larger than bootstrap capacitor C4 is recommended.
21. Please choose the electrolytic capacitor with good temperature characteristic in C4. Choose 0.1~0.2 $\mu$ F R-category ceramic capacitors with good temperature and frequency characteristics in C1.
